

Driven response of the corrected MEMS model

Native Julia simulation 20 Hz 4.95 *g* peak 3 V bias 8 cycles

The ramp ends at 200 ms (vertical dashed line). Horizontal dotted lines in (a) mark nominal tip contact, $x_2 = \pm 13.71 \mu\text{m}$.

The voltage overview is sampled at $50 \mu\text{s}$ intervals; use the contact and final-cycle figures for narrow pulses. Reference predictions, not calibrated device measurements.
